Compare the measurements — reserved fresh check

Stage-separated edition · 2 November 2026

Fresh check — use after the named response practice

Fresh check · The goal now is to limit cooling. Fresh 100 g water samples begin at 34°C in a 22°C room. Two 20-minute trials use matching cups, lids, and measurement methods.

Final water temperatures after 20 minutes

Constructed teaching data: these values were invented for this activity, not collected in an experiment.

Trial	Start (°C)	Sleeve P: final °C	Sleeve Q: final °C
1	34	29	31
2	34	28	30

3. Which sleeve better limits cooling? Give both temperature drops. Is the lowest endpoint the best choice for this goal?
